

CASE STUDY – CONTRACT ANNOTATION

OUR CLIENT

Our Client is a legal technology firm intending to train Artificial Intelligence that understands various legal concepts in contracts.

WHAT WE DO

Our responsibility is to make our client's algorithms more intelligent. Our work allows the machine to understand law, contractual obligations and create Artificial Intelligence specifically tailored for lawyers. We provide assistance in annotating legal contracts, non-disclosure agreements and software licensing agreements according to our client's requirements of core, modifier and region annotations for various clauses in the agreements.

THE PROCESS

The categorization will be done on our client's Google shared excel document which will contain the legal contracts to be Annotated. Each of our team members is provided direct access and client interactive window for error mitigation.

We annotate each legal contract in accordance to its exhaustive Tagging set/ Tag Set based on Core, modifiers and specific region clauses to enable writing algorithms more appropriate and relevant.

Our legal team undertakes the following steps in doing this task:

1. Read and understand the legal contract thoroughly from preamble, terms and conditions till the end.
2. Recognize and add each applicable annotation to the clauses in the legal contract.
3. If an Annotation added to the legal contract clause has any additional core tagging point, we have to add the applicable "Tag" to that legal contract clause. To add multiple "Annotations", we will be adding separate tag category from those "predetermined tag points".
4. We take utmost care to ensure that the tagged legal concepts are directly relevant to the required tagging category of the contract.
5. Our team ensures that our client's NLP, AI and ML value addition is seamless, highly efficient and time saving.
